target = 0

Sorting

Quadruple

Prevent from Repetition
 \rightarrow How + check of previous element

$$\text{val}_1 + \text{val}_2 + \text{val}_3 + \text{val}_4 = \text{target}$$

- ① Sorting -
- ② val_1 considered in loop from $i=0$ to $(n-3)$

K sum : Target Sum Unique Set

Sunday, 5 September 2021

8:42 PM

Time $\rightarrow (n^{k-1} + n \log n)$ if $k=2$

array

K values
sum = target

val 1

$k-1$ vals sum = target - val 1

Base problem

Base case of

Recursion of K sum
if ($k=2$) solve pair problem

Set 1 + val 1

Set 2 + val 1

Set 3 + val 1

Set 4 + val 1

Repeat

for (int i = 0; i < n - k; i++)

$k-1$ - set

complexity to find prime Number $\rightarrow O(\sqrt{n})$

upper Range \rightarrow query \rightarrow \odot to upper Range
 of is prime
 (1)

$q \gg n$

\rightarrow Reduce complexity in \rightarrow $O(q)$

NOT! sieve of eratosthenes can find is prime
 in $O(1)$ time complexity.

How ??

complexity \rightarrow $q \times \sqrt{n}$
 \rightarrow val = upper Range
time
 \hookrightarrow $q \times \sqrt{n}$

n=30 — find all prime between 0 to 30

we sacrifice with space to reduce time complexity.

make a boolean array of size $n+1$

$arr[i] == \text{True}$

⇒

i is prime no or not prime

All factors of n is already marked

0 - upper bound

complexity \rightarrow

preprocessing time complexity $\rightarrow O(n \log \log n)$

complexity of query \downarrow

$$2^{-1} \quad 2^{-2} \quad 2^{-3} \quad 2^{-4} \quad 2^{-5}$$

$$= \frac{n}{2} + \frac{n}{3} + \frac{n}{5} + \dots$$

$$\frac{n}{\sqrt{k}}$$

$$= \frac{38}{7} = 5 \dots$$

number

$$\sum \frac{n}{i}$$

where 'i' is prime b/w 2 to \sqrt{k}

= sum of inverse of prime
 \rightarrow convergence - divergence

concept

$$= n \left[\log(\log(n)) \right]$$

nearby \downarrow [at $n \approx 25$]

so overall time complexity \rightarrow

$$\frac{n (\log \log n)}{2} \approx n$$

$$\approx 2n \approx n$$

$$\approx O(n)$$

max prime no. 2 to \sqrt{n}

$$O(L)$$

$$2 \text{ to } \sqrt{30} \quad n \sim 30$$

$$25$$

$$\log \log n$$

$$10^9 = 2^{32} = 5$$

$$\log \log(10^9) =$$

$$\log \log(2^{32})$$

$$\log(32) = \log(2^5)$$

$$5 \times 10^5 = 5 \times 10^5$$

Steps to code Sieve Algorithm.

- ① Make a boolean array of size $n+1$:
By default \rightarrow False
 \downarrow
Prime
True is used as marker
- ② Mark all number as prime i.e. $arr[i] = \underline{\text{true}}$
- ③ Travel from 2 to \sqrt{n} , if $arr[i] == \underline{\text{True}}$,
then mark its multiple as not prime, $\rightarrow arr[\text{factor}] = \text{False}$
if $(arr[i] == \text{False}) \rightarrow$ continue,
if it is marked \rightarrow then its factor are already marked.
- ④ Return is prime array.

allowed Time complexity $\Rightarrow (b-a) \log \log (b-a)$

✓ Approach 0 \rightarrow Check Every Number in query if it is prime or not. \times
 \hookrightarrow May be it will pass test cases but not match with Required time compl. Time complexity $\rightarrow \underline{\underline{O(\sqrt{b})}}$

✓ Approach 1 \rightarrow sieve \rightarrow make of size $\underline{\underline{b+1}}$

\hookrightarrow constraints.

① $1 \leq a \leq b \leq 10^9 \rightarrow$ Range of a & b

\hookrightarrow we can't make size of array as b .

because max. allowed size in array is of order 10^5 .

② $b - a \leq 10^5$

\rightarrow Not even pass test cases

Missing constraints

Segmented Sieve →

$a = 22$, $b = 51$

Lower Range = a

Upper Range = b

$b - a \leq 10^5$

$1 \leq a \leq b \leq 10^9$

Size of = $b - a + 1 = 51 - 22 + 1 = 30$

a and b both are prime no. b/w a to \sqrt{b} (using sieve)

Included:

③ → marking of not prime

arr[i] = false

i → is prime no.

begin with starting index of multiple of prime no

val =

index + Base value

$17 + 22 = 39$

How to find Starting Index of Multiple of prime Number.

prime \rightarrow 2, 3, 5, 7

$$\text{multiple} = \left\lceil \frac{a \times 1.0}{\text{prime}[i]} \right\rceil \quad m = \left\lceil \frac{22 \times 1.0}{7} \right\rceil$$

$$= \lceil 3.14 \rceil = 4$$

Exception \rightarrow 2 \rightarrow not prime

prime \rightarrow 2, 3, 5, ...

$$\text{multiple} = \left\lceil \frac{2 \times 1.0}{2} \right\rceil = 1$$

$$\text{start index} = 1 \times 2 = 2$$

$$\text{start} = 0$$

Imp \rightarrow $\text{multiple} = 1$ \rightarrow $\text{multiple}++$

$$\text{Starting Index} = \text{multiple} * \text{prime}[i] - a$$

$$81 = 4 * 7 = 28$$

$$= 28$$

Steps to solve Segmented sieve - $\left\lceil \frac{b}{10^4} \right\rceil = 18^4 \rightarrow \underline{\underline{\text{Sieve}}}$

- ① Get prime no b/w a to \sqrt{b} using sieve
- ② Solve b/w $b-a$ array, and find starting

Index as

$$\text{multiple} = \left\lceil \frac{a + 1.0}{\text{prime}[i]} \right\rceil_{\text{ceil}} \quad \text{if multiple} \neq 1$$

multiple \neq

$$s.i = \underbrace{\text{multiple} * \text{prime}[i] - a}$$

- ③ get value of prime using.

$$\text{val} = \text{Index} + \underbrace{\text{Base value}}_a = \underline{\underline{\text{Index} + a}}$$

Pair with difference K
